# A KEY TO THE BITING MOSQUITOES OF NEW ENGLAND* 

By George S. Tulloch

A study of the infestation and distribution of biting mosquitoes in Massachusetts was made during the spring and summer of 1930. To facilitate the identification of the mosquitoes found, the following key ${ }^{1}$ was constructed; it being taken from Dyar ${ }^{2}$ and Matheson ${ }^{3}$ and modified to include those species known to occur to New England. It is accompanied by a plate illustrating many of the taxonomic characters used in identification and by a few notes concerning mosquitoes considered to be of interest.

## Table of Genera

## Adults

1. Metanotum with a tuft of setæ.....................Wyeomyia

Metanotum without a tuft of setæ ........................ 2
2. Wings with the second marginal cell not half as long as its petiole Uranotænia

$$
\begin{aligned}
& \text { Wings with the second marginal cell more than half } \\
& \text { as long as its petiole ........................................ } 3
\end{aligned}
$$

3. Scutellum rounded-not lobed
Scutellum not rounded-distinctly trilobed ..... 4

[^0]4. Cross veins tending to lie in line, or mesonotum with bare impressed discolorous lines or both....Theobaldia
Cross veins normal, mesonotal integument without impressed discolorous lines ..... 5
5. Abdomen of female blunt, with short cerci ..... 6
Abdomen of female pointed, cerci exserted ..... 7
6. Wing scales normal ..... Culex
Wing scales distinctly large and broad Mansonia
7. Abdomen of female with the eighth segment wholly retractile, nude; spiracular bristles present
Psorophora
Abdomen of female with the eighth segment onlypartially retractile, spiracular bristles absent..Aedes
Larvæ

1. Eighth segment of abdomen provided with a distinct elongate dorsal siphon or respiratory tube ..... 2
Eighth segment without a distinct elongate dorsal siphon ..... Anopheles
2. Anal segment without ventral brush Wyeomyia
Anal segment with ventral brush ..... 3
3. Air tube without pecten Mansonia
Air tube with pecten ..... 4
4. Air tube with several pairs of ventral tufts ..... Culex
Air tube with a single pair of tufts ..... 5
5. Head elongate, elliptical Uranotænia
Head nearly circular or transverse ..... 6
6. Air tube with tufts close to base Theobaldia
Air tube with tufts near the middle or beyond ..... 7
7. Anal segment ringed by the dorsal plate, with hair tufts piercing the ring

Psorophora
Anal segment not ringed by the dorsal plate or if ringed, the hair tufts posterior to the ring......Aedes

## Table to Species of Theobaldia

Adults

1. Tarsi with faint whitish rings at both ends of joints morsitans

Tarsal white rings, if present, basal 2
2. Scales of the wings all black or brown, no white scales impatiens
Scales of the wings mixed, black or brown or white, especially along the costal margin inornata

## Larvz

1. Pecten of the air tube produced into long hairs on the outer half
Pecten not produced into long hairs on outer half morsitans
2. Both pairs of head hairs multiple (6) and of about equal length impatiens
Lower head hairs of three or four long hairs; upper multiple and shorter than the lower head hair
inornata
Table to Species of Anopheles

## Adults

1. Wings with white or yellowish white spots along costal margin
punctipennis
Wings without such marking ............................... 2
2. A bronzy or coppery spot at apex of wing maculipennis

Apex of wing uniformly dark colored .................... 3
3. Segments of palpi white scaled at apices............walkeri

Segments of palpi uniformly dark scaled
quadrimaculatus

## Larvæ

1. Abdomen with six pairs of dorsal palmate tufts.. 2

Abdomen with five pairs of dorsal palmate tufts.. 3
2. Mandibles with eleven terminal teeth; six branched hairs on mandibles arranged in an outward projecting row
quadrimaculatus
Mandibles with nine terminal teeth; ten branched hairs on mandibles, arranged in a forward projecting row walkeri
3. Lateral plate of the eighth abdominal segment with 22-29 (8 to 9 long) teeth .........................maculipennis

Lateral plate of the eighth abdominal segment with 17-22 (usually 6-7 long) teeth punctipennis

## Table to Species of Culex

1. Abdominal segments transversely white banded apically apicalis

Abdominal segments with white bands basally or none
2. Abdominal segments without basal white bands salinarius

Abdominal segments with basal white bands 3
3. Basal white band of the second abdominal segment usually not triangularly produced medianly territans

Basal white band of the second abdominal segment triangularly produced medianly
pipiens

## Larvæ

1. Antenna with the tuft at or before the middle territans
Antenna with the tuft well beyond the middle........ 2
2. Both upper and lower head hairs multiple ........ 3
Both upper and lower head hairs not multiple....apicalis
3. Air tube long and slender-7x1, slightly expanded
before the apex
Air tube not over $5 \times 1$, uniformly tapering toward the
apex

Table to Species of Aedes
Adults

1. Tarsi not white marked ............................................ 2

Tarsal joints or some of them white marked........ 12
2. Mesonotum with silvery or golden markings ........ 3

Mesonotum gray, brown, or golden yellow with a single median dark longitudinal band, two narrow lines, or unmarked

3. Mesonotum with two yellowish or yellowish silvery
stripes on a dark ground
trivittatus

Mesonotum marked with silver, rarely absent........ 4
4. Silver in a broad or narrow line reaching scutellum
or mesonotum entirely silvered (in the male).... 5

Silver on the sides of the mesonotum, the center dark triseriatus
5. Both sexes with a narrow silver stripe..........atlanticus

Female with stripe, male mesonotum entirely silvery dupreei
6. Mesonotum with central broad undivided dark band 7
Mesonotum with divided central band or none ...... 9
7. Mesonotum with median band very broad, lateral lighter color narrow ..... 8
Mesonotum creamy yellow at the sides
hirsuteron

Mesonotum golden or reddish brown at the side, median stripe sometimes divided or obsolete......punctor
8. Yellow lateral lines straight and narrow
aurifer
These lines narrowed posteriorly, pale gray...trichurus
These lines narrowed posteriorly, pale gray...trichurus
9. Mesonotum with paired brown lines ..... 10
Mesonotum uniformly colored, without lines ..... 11
10. Mesonotum yellow or gray, very variable, sometimes suffused with brown centrally, or the lines obsolete; medium-sized to rather large species, legs black, venter yellowish white ..... communisLegs black with bronzy reflection, venter whiteimplacabalis
Mesonotum yellow, lines slender, often conjoined intoa median stripe, deep black .........................diantæus
Mesonotum gray with central brown shade, lines fine,dark, a small speciesimpiger
11. Mesonotum uniformly dark brown, somewhat bronzy, lower mesepimeral bristles present, a medium sized species intrudens
Mesonotum uniformly brown; abdomen with continu- ous lateral white line, male with short palpi; mese- pimeral bristles absent ..... cinerus
12. Tarsi with white rings involving both ends of the joints ..... 13
Tarsal white rings basal only ..... 15
13. Wing-scales markedly bicolored ..... dorsalis
Wing-scales uniformly dark, or nearly so ..... 14
14. Mesonotum uniformly brown, or nearly so...canadensisMesonotum pale, with broad dark median stripe
15. Proboscis of the female white ringed ..... 16
Proboscis of the female without white ring. ..... 17
16. Abdomen with a longitudinal page dorsal stripe
sollicitans
Abdomen without a dorsal stripe. tæniorhynchus
17. Tarsal pale rings broad, especially on hind legs. ..... 18
Tarsal pale rings narrow; mesonotum entirely brown20
18. Wing scales broad, inflated ..... grossbecki
Wing scales narrow, normal ..... 19
19. Large, without the red tint, mesonotum usually not whitish on the sides, wing scales dark; without mesepimeral bristles ................................excruciens
With 3-5 lower mesepimeral bristles ..... stimulans
Mesonotum often whitish on the sides, wings oftenwith scattered white scales. 2 lower mesepimeralbristles .................................................................ftchii
20. Terminal abdominal segments with normal pale brands ..... vexansTerminal abdominal segments largely pale-scaled cantator
Larvæ

1. Air tube with tuft within pecten ..... 2
Air tube with tuft beyond pecten ..... 3
2. Air tube with several dorsal hair tufts trichurus
Air tube without several dorsal hair tufts ...atropalpus
3. Pecten with detached teeth outwardly ..... 4
Pecten without detached teeth outwardly ..... 9
4. Air tube at least $31 / 2$ times long as wide ..... 5
Air tube less than 3 times long as wide ..... 6
5. Both pairs of dorsal head hairs multiple ..... cinerus
Both pairs of dorsal head hairs double ..... excrucians
6. Antennæ enlarged basally ..... aurifer
Antennæ not enlarged basally ..... 7
7. Antenna as long as head diantrus
Antenna not as long as head ..... 8
8. Lateral abdominal hairs single beyond second
intrudens
Lateral abdominal hairs multiple on 1st and 2nd, dou- ble 3-5 vexans
9. Comb scales in a single row ..... 10
Comb scales in a triangle ..... 11
10. Anal segment ringed by plate implacabalis
Anal segment not ringed by plate triseriatus
11. Anal segment ringed by plate ..... 12
Anal segment not ringed by plate ..... 15
12. Upper and lower head hairs double punctor
Upper and lower head hairs single ..... 13
13. Anal gills at least as long as anal segment. trivattatus
Anal gills shorter than anal segment ..... 14
14. Lateral abdominal hairs double on 3-6. ..... sollicitans
Lateral abdominal hairs triple 3-5, single on 6
tæniorhynchus
15. Air tube at least 4 times as long as wide ..... fitchii
Air tube 3 times or less as long as wide ..... 16
16. Head hair single ..... 17
Head hairs double or multiple ..... 19
17. Anal gills at least as long as anal segment ..... 18
Anal gills much shorter than anal segment ..... dorsalis
18. Scale of comb with broad apex, 4-7 stout spinescommunis
Scale of comb with single stout spine impiger
19. Both pairs of dorsal head hairs multiple ..... 20
Both pairs of dorsal head hairs not multiple ..... 21
20. Anal gills budlike cantator
Anal gills well developed canadensis
21. Lower head hairs double-upper 3 hirsuteron
Upper double-lower single stimulans

The following genera are each represented by a single species: Mansonia perturbans, Uranotaenia sapphirina, Psorophora ciliata, Wyeomyia smithii.

A large part of the study was restricted to the habits and biology of A. sollicitans. The eggs of this species are distributed over the salt marshes and during the summer months hatch when flooded by the waters of the tides and rains. The larvæ appear soon after the marshes are flooded and under favorable conditions develop in 7 to 12 days. Usually only the larvæ in the pools left by the peak tides (those most distant from the ocean, within 100 to 200 yards of the mainland) ${ }^{4}$ successfully complete their development since these pools are free from larvaeating fish and are not flushed by the succeeding lower tides. In a particularly dry season the water in many of the smaller pools along the edge of the marsh evaporates before the larvæ complete their development, thereby effecting a natural means of control. Pools formed by heavy rainfall are usually small and dry out rapidly and the larvæ are destroyed.

[^1]Several chlorine determinations ${ }^{5}$ of water from pools containing larvæ of A. sollicitans were made. The results of these determinations indicate that the larvæ can live and develop in water having a chlorine content ranging from 400 to 2900 parts per 100,000 parts of water. Since the chlorine content of open sea water contained only 2000 parts, it is evident that larvæ can developed in water having a chlorine content greater than sea water as well as in water having a chlorine content considerably less than sea water.

Several evening collections of fresh water species were made in the Charles River Valley. The collections made in late May and early June yielded A. cinerus, A. excruciens and $A$. implacabalis in about equal numbers. During July and August the collections contained a majority of M. perturbans. Of 120 specimens taken in one collection at Needham, Mass., in August, 118 were of this species, 1 of A. punctipennis and 1 of $C$. pipiens. M. perturbans is a difficult mosquito to control as the larvæ are not free swimming but attached to roots and stems of various aquatic plants. The adults are fierce biters but fortunately are weak flyers.
